

Functional Requirements Document (FRD)

Rajasvi Decor – CRM Lead & Requirement Management Enhancements

Meeting Date: 09 September 2026

Module: CRM / Lead Management

Document Type: Functional Requirements Document

Purpose: To define the requirements discussed for capturing customer, order, product, customization, sample, delivery, follow-up, and lead-source information in the CRM.

1. Objective

The objective is to enhance the CRM lead management process for Rajasvi Decor by capturing complete customer and requirement details at the lead level.

The system should allow internal users to understand the customer's business profile, requirement, expected order value, product preferences, customization needs, sample requirements, delivery details, and follow-up information from a single lead record.

2. Customer Information

The system should capture the following basic customer details:

Field	Description
Customer Name	Name of the customer/company
Contact Person	Primary person to contact
Business Type	B2B / B2C
Customer Type	Corporate, Hotel, Wholesaler, Retailer, Event Planner, Individual

The **Customer Type** should be selectable from predefined options.

3. Requirement Details

The CRM should capture the customer's requirement to help the sales team understand the nature and priority of the opportunity.

3.1 Requirement Type

The following requirement types should be available:

- Regular Requirement
- Bulk Requirement
- Gifting
- Wedding
- Event
- Reselling
- Other

3.2 Requirement Purpose

A field should be available to capture the purpose for which the customer requires the product.

3.3 Quantity and Order Value

The system should capture:

- Expected Quantity
- Budget per Candle
- Expected Order Value

The expected order value may be used by the sales team to evaluate the potential value of the lead.

4. Delivery Requirement

The system should capture the customer's expected delivery requirement.

Required Information

- Expected Delivery Date
- Delivery Urgency
- Main Order Delivery Address

Functional Consideration

The delivery date should be treated as an **expected delivery date** rather than a guaranteed delivery date.

If the actual delivery date changes due to delay or other operational reasons, the system should allow the updated date to be maintained without losing the original customer requirement.

5. Product Selection

After capturing the customer requirement, the internal user should be able to select the product(s) proposed for the customer.

The selected product should be linked to the lead/order requirement.

Product-related details should be maintained against the selected product as applicable.

6. Customization Requirements

The system should provide an option to identify whether the customer requires customization.

Customization Required

Yes / No

If **No** is selected, no additional customization details should be mandatory.

If **Yes** is selected, the user should be able to specify the required customization.

Customization Options

- Logo
- Label
- Frame
- Colour
- Shape
- Packaging
- Special Design
- Other Customization

Additional Details

A free-text field should be available to capture specific customization instructions provided by the customer.

The customer may also provide their own logo/design or other reference material. The system should support attachment of such files.

7. Packaging Requirements

Packaging requirements should be captured separately.

Packaging Type

Possible options include:

- Gift Box
- Box
- Pouch
- Other

Branding

The system should capture whether branding is required:

Branding Required: Yes / No

Packaging Instructions

A remarks/instructions field should be available for any special packaging requirements provided by the customer.

8. Sample Requirement

The CRM should provide a separate section for managing sample requirements.

8.1 Sample Required

Yes / No

If **No** is selected, the system should not require sample-related details.

If **Yes** is selected, the following information should be captured:

- Sample Type
- Sample Quantity
- Sample – Paid / Free
- Sample Delivery Date
- Sample Delivery Address
- Sample-related Attachment, if applicable

8.2 Sample Delivery Address

The sample delivery address should be maintained separately from the main order delivery address.

The system should allow the user to use the **same address** as the main order address or enter a **different address** specifically for the sample.

9. Main Order Delivery Address

The main order delivery address should be maintained independently from the sample delivery address.

This is required because:

- The sample may be delivered to one location.
- The final/main order may be delivered to another location.

The system should therefore provide separate address fields/sections for:

1. Sample Delivery Address
 2. Main Order Delivery Address
-

10. Lead Follow-up

The captured customer and requirement information should be available for the lead follow-up process.

The CRM should allow internal users to manage follow-ups against the lead and maintain relevant follow-up information.

Any attachment required for follow-up or customer communication should also be supported.

11. Lead Source & External Integrations

The meeting discussed receiving leads from external platforms such as:

- Facebook
- Instagram
- Meta
- Other supported external sources

Integration Requirement

The CRM should support receiving lead data through **API/Webhook-based integration**, wherever the respective platform provides the required integration capability.

The incoming lead data should be mapped to the corresponding CRM lead fields.

Plugin/API Dependency

Where required, the relevant plugins or integrations should be installed/configured to receive data from external platforms.

12. Suggested Lead Flow

The overall process should work approximately as follows:

Lead Received → Customer Details → Business/Customer Type → Requirement Details → Quantity & Budget → Product Selection → Customization → Packaging → Sample Requirement → Delivery Details → Follow-up → Order Conversion

For external leads:

Facebook / Instagram / Meta → API/Webhook → CRM Lead → Requirement Capture → Follow-up
