

Functional Requirement Document (FRD)

Project Name - Rajasvi Decor CRM – Requirement and Process Enhancements

1. Purpose

This document covers the functional changes and enhancements discussed during the Rajasvi Decor CRM demo. The requirements mainly focus on improving the flow for requirements, products, samples, delivery addresses, customization, lead creation, pricing, and order invoices.

2. Requirement Management

2.1 Multiple Requirements

The system should allow users to add multiple requirements under a single lead. Each requirement should be maintained separately so that products, samples, customization, and other related details can be managed requirement-wise.

A new requirement should also be added later under the same lead if the customer provides another requirement.

2.2 Product Mapping with Requirements

Products should be linked to their respective requirements. Users should be able to view the products added against each requirement.

The system should clearly show which products belong to which requirement.

2.3 Product Pricing and Amount

When a product is selected, the relevant product price should be displayed.

The total amount should be calculated based on:

Quantity × Unit Price

Product-wise amounts should be visible separately instead of showing only a combined total.

3. Sample Management

3.1 Default Sample Products

By default, the sample section should display products related to the selected requirement.

The user should also have the flexibility to add additional products for samples, even if those products are not included in the original requirement.

3.2 Sample Quantity

Users should be able to enter the required sample quantity for each product.

If a sample is not required for a particular product, the quantity can be entered as zero or the product can be removed from the sample list.

3.3 Additional Sample Products

An option should be provided to add more products to the sample list.

If products outside the original requirement are added as samples, the system should notify or confirm this action with the user.

3.4 Free and Paid Samples

Samples should be marked as **Free by default**.

The system should support both:

- Free Sample
- Paid Sample

For free samples, the amount should be displayed as **0**.

For paid samples, the applicable amount should be calculated and displayed accordingly.

4. Delivery Address Management

4.1 Address at Contact Level

Delivery addresses should be managed at the contact level so that the same contact can have multiple saved addresses.

These addresses should be available for selection whenever a new requirement or order is created for that contact.

4.2 Adding New Addresses

Users should be able to add a new delivery address when required.

Once added, the new address should be saved in the contact's address details for future use.

4.3 Sample and Main Product Delivery

The system should allow users to manage delivery addresses for:

- Sample Delivery
- Main Product Delivery

Users should be able to select the same address for both or choose different addresses based on the requirement.

4.4 Multiple Delivery Locations

The system should support scenarios where products need to be delivered to multiple locations.

The delivery quantity should be manageable according to the selected delivery address or location.

The overall flow should also support future requirements involving multiple delivery locations and separate invoices.

4.5 Address-Related Details

The system should consider additional details such as:

- Company Name
- GST Details

Since GST and business details may vary depending on the state or company location, the address structure should support such variations.

5. Customization Management

5.1 Requirement-Wise Customization

Customization should be managed according to the respective requirement.

The customization section should be available only when customization is required.

5.2 Multiple Customizations

Users should be able to add multiple customization options under a single requirement.

For example, a requirement may include multiple customizations such as:

- Logo
- Special Print
- Special Message
- Special Design Instructions

All selected customization details should be displayed under the respective requirement.

5.3 Logo Upload

The system should allow users to upload a logo or image for customization.

A preview of the uploaded image should be available so that the user can verify the uploaded file.

The system should also consider file size requirements where applicable.

5.4 Special Instructions

Users should be able to provide special customization or design instructions wherever required.

6. Lead Creation

When a new contact is added, a lead should be automatically created using the same contact details.

This will reduce duplicate data entry and maintain a connection between the contact and lead records.

7. Order Invoice

An Invoice feature should be available for orders.

The system should support invoice generation as part of the order management process.

8. B2B Customer Categorization

B2B customers should be categorized properly to support different types of business customers.

The categories may include:

- Wholesalers
- Distributors
- Local Retail Shops
- Regular Clients
- Corporate Clients
- Hotels and Resorts

A B2B master should be created to manage these customer categories.

9. Customer and Category-Based Pricing

The system should support different pricing based on the customer or customer category.

Different customers may receive different product rates depending on their business type, relationship, or other business conditions.

For existing customers, the system should also allow users to refer to previous product prices.

For example, if a customer places another order, the system can show the price at which the same product was previously sold to that customer.

10. Location-Based Pricing and Feasibility

Pricing and shipping costs may vary depending on the delivery location.

The system should be designed in a way that supports future requirements related to:

- Location-based pricing
- Shipping cost variations
- Customer-specific pricing
- Delivery feasibility

The final structure should be reviewed carefully so that future business requirements can be accommodated without requiring major changes to the existing system.
